BUSINESS AREAS
Technical and Innovation R&D Area COMSA INDUSTRIAL

DURATION
2020 – 2024

BUDGET
Consortium Budget: 15.717.821,75 €
COMSA Budget: 1.972.698,00 €

KEYWORDS
5G, Multi-tenant, CCAM and FRMCS, Network infrastructure

COORDINATOR
Manuel Alfageme

H2020 ICT FUNDING

Title of the project
Sustainable 5G deployment model for future mobility in the Mediterranean Cross-Border Corridor

Acronym
5GMED

Content of the project
5GMed brings together key stakeholders of the "Barcelona – Perpignan" cross-border section of the Mediterranean corridor, including MNOs, road and rail operators and neutral hosts, complemented with innovative SMEs developing AI functions, and selected R&D centres with a proven track record in 5G research and innovation. Given the proximity of the E15 highway and the high-speed rail track in the considered cross-border section, the 5GMed consortium will demonstrate how a multi-stakeholder 5G infrastructure featuring a variety of technologies, including Rel.16 5GNR at 3.5 GHz, Rel.16 NR-V2X at 5.9.GHz, unlicensed mm-wave, network slicing and service orchestration, can be used to jointly deliver CCAM and FRMCS services.

The considered CCAM use cases include Remote Driving in cross-border open roads to enable safe fallback operation in Level 4 autonomous driving, and the massive sensorisation of road infrastructures enabling AI-powered traffic management algorithms in the presence of legacy vehicles. The considered FRMCS use cases include performance services where AI-functions running on the infrastructure side analyze camera feeds from high-speed trains in real-time and business services providing high-speed internet to passengers and in-train neutral hosting capabilities to MNOs.

A Follow Me Infotainment use case will demonstrate live migration of media functions across cross-border scenarios both in automotive and railways environments.

General objectives
5GMed will demonstrate advanced CCAM and FRMCS services along the "Barcelona – Perpignan" cross-border corridor, enabled by a multi-stakeholder compute and network infrastructure deployed by MNOs, neutral hosts, and road and rail operators, based on 5G Rel.16 and offering support for AI functions.

Project tasks
I. Project Management
II. Use Case definition and Trial specification
III. Technological extensions for scalable and multi-tenant 5G Infrastructure in main transport paths
IV. Automotive use case technology development and initial validation
V. Railways use case development and initial validation
VI. Use case validation in cross-border corridor and small scale
VII. Enabling cross-border 5G deployment and business across Europe
VIII. Impact Maximization

Results and conclusions
The project is currently in its ongoing phase.
